Answer the questions in the spaces provided. If you run out of room for an answer, continue on the back of the page.

1. Given the equation $x^n + y^n = z^n$ for (x, y, z) and n positive integers.

(a) For what values of n is the statement in the previous question true? (*10 points*)

I know the demostration, but there's no room on the margin. For any clarification ask Andrew Whilst.

(b) For $n = 2$ there's a theorem with a special name. What's that name? (*10 points*)

Pythagorean theorem.

(c) What famous mathematician had an elegant proof for this theorem but there was not enough space in the margin to write it down? (*10 points*)

.

2. Prove that the real part of all non-trivial zeros of the function $\zeta(z)$ is $\frac{1}{2}$. (*20 points*)

I'm working on it. When I have the solution, I'll let you know....
