(b) For n=2 there's a theorem with a special name. What's that name?

1. Given the equation  $x^n + y^n = z^n$  for (x, y, z) and n positive integers.

(a) For what values of n is the statement in the previous question true?

(c) What famous mathematician had an elegant proof for this theorem but there was not enough space in the margin to write it down?

Answer the questions in the spaces provided. If you run out of room for an answer, continue

.

2. Prove that the real part of all non-trivial zeros of the function  $\zeta(z)$  is  $\frac{1}{2}$ .
